Zomato Data Analysis

Insights from Restaurant Listings Dataset

- **Title:** Zomato Data Analysis
- **Subtitle:** Exploratory Data Analysis & Insights
- **Author:** Sahil Dahariya
- **Tools Used:** Python, Pandas, Matplotlib, Seaborn

- **Slide 2: Introduction**

- Zomato is a global restaurant discovery and food delivery platform

- Dataset contains information about:
  - Restaurants
  - Ratings
  - Locations
  - Cuisines
  - Cost for two

- Goal: Extract insights and understand customer preferences

- **Slide 3: Objectives**
- Analyze restaurant distribution by city
- Identify popular cuisines
- Study rating patterns
- Understand cost vs rating relationship
- Detect trends in online delivery & table booking

- **Slide 4: Dataset Overview**
- Number of records: ~148
- Key features:
  - Restaurant Name
  - Location
  - Cuisines
  - Average Cost for Two
  - Rating
  - Votes
  - Online Delivery (Yes/No)

- **Slide 5: Data Cleaning**
- Removed missing/null values
- Converted ratings to numeric format
- Filtered invalid entries (e.g., “NEW”, “-”)
- Standardized column names

- **Slide 6: Restaurant Distribution**
- Most restaurants are concentrated in urban cities
- High density in metro areas
- Visualization: Bar chart (Restaurants per City)

- **Slide 7: Online Delivery Analysis**
- Majority of restaurants offer online delivery
- Urban regions show higher adoption
- Insight: Delivery is a key factor in business success

- **Slide 8: Ratings Distribution**
- Most ratings fall between **3.5 – 4.5**
- Few restaurants have very low ratings
- Visualization: Histogram

- **Slide 9: Cost vs Rating**

- Moderate-cost restaurants often have better ratings

- Very high-cost restaurants don’t always guarantee high ratings

- Visualization: Scatter plot

- **Slide 10: Popular Cuisines**
- Most common cuisines:
  - North Indian
  - Chinese
  - Fast Food
- Insight: Multi-cuisine restaurants perform better

- **Slide 11: Votes vs Rating**
- Restaurants with more votes tend to have stable ratings
- High engagement → higher credibility

- **Slide 12: Table Booking Analysis**
- Restaurants with table booking:
  - Usually higher rated
  - More premium
- Insight: Premium services improve customer perception

- **Slide 13: Key Insights**
- Online delivery boosts restaurant reach
- Mid-range pricing attracts more customers
- Ratings depend on both quality & engagement
- Location plays a major role in success

- **Slide 14: Conclusion**
- Zomato dataset reveals strong urban food trends
- Customer behavior favors:
  - Convenience (delivery)
  - Variety (cuisines)
  - Value for money
- Data-driven strategies can improve restaurant performance

- **Slide 15: Future Work**
- Build recommendation system
- Predict restaurant ratings using ML
- Sentiment analysis on reviews
